Involvement of an enterprise-consumer in the decision-making process: approaches, definitions, factors and structure of formation

Introduction: Effective promotion of industrial goods in the market should be determined on the basis of knowledge as to the choice of strategies of the decision approval by organization-customer concerning purchase of goods. Level of involvement is the factor that determines the type of behavior when making decision concerning purchase (usual stereotyped, limited problem or extended decision), and hence the strategy of the choice (compensating or uncompensated one). Ukrainian scientists pay insufficient attention to the study of the concept of involvement, its types, properties and determining of the level of involvement, while foreign scientists mainly study the process of involvement within the market of consumer goods. A variety of views on the notion of “involvement”, its definition, factors and structure of its formation caused the choice of topic. Moreover, the available results of research have not been accepted yet to be used on the market of industrial goods, though certain notions and methodological bases can be adapted for the study of problems of consumer product promotion to organization-customer. Therefore, study and systematization of approaches to the definition of the notion of “involvement” and systematization of its types, development of involvement level formation structure, definition of the place of the involvement components during the process of making a decision by organization-consumer is the aim of this work.

According to the aim, the following tasks are set: to analyze approaches to the definition of the notion of “involvement” and systematize them, to review and classify the main types of involvement, to investigate factors influencing the involvement formation level and to develop an involvement formation level structure based on the nature of the factors of influence, to determine the place of the involvement components during the process of making decision concerning purchasing by the organization-customer.

There are different definitions of the notion “involvement”, which changed together with the development of scientific thought. At first this term was used to explain the perception of communications by a person\(^1\). Later on the famous Michael L. Rothschild’s definition was

approved as the basic one², which was specified by Judith Lynne Zaichkowsky³, and is widely used by many scientists⁴. Though afterwards J.L. Zaichkowsky⁵ modified the definition, having changed an object of involvement into advertisement, thus moving the centre from involvement into the product for involvement in purchasing situation or advertising message. The basic approaches to definition of the notion “involvement” are systematized by us in table 1.

Zaichkowsky J.L.⁶ on the basis of researches⁷ proposed to distinguish three categories of factors, which influence the level of involvement: personal – inherent interests, needs and values that motivate the subject of involvement concerning an object; physical – characteristics of an object of involvement; situational – anything that temporarily gives actuality or importance concerning an object. Later these groups of factors were transformed into the main factors of involvement formation⁸: connected with characteristics of the subject of involvement, characteristics of incentives and purchasing situation. One or more of these factors influence the level of involvement in the product, purchasing situation or involvement by advertising. Some of the researchers specify the constituents of these three factors of formation of consumer involvement level or the ways of consumers’ reaction to advertisement, product or purchasing situation.

Involvement has particular properties: intensity, direction and stableness.

Source: own elaboration

**Intensity** is a defined degree of readiness to involvement, by which a consumer is ready to work up information or reaching the aims connected with purchasing behavior. Intensity refers to the level of readiness and does not actualize a process or behavior that are the consequences of involvement. This level of intensity is a continuum that changes the value from high to low involvement levels. In their work American researchers note the importance of this involvement function for middle involvement levels that is usually ignored in experimental investigations. The noticeable exclusion from this statement is some studies of influence effects of the source of conviction (Heesacker, Petty, Casioppo 1983; Puckett, Petty, Casioppo, Fasher 1983)\(^{10}\). As Petty R. E. and Casioppo J. T.\(^{11}\) defined, the initial (that are the source) and external (peripheral) factors can differently influence the degree of information processing, when personal importance of a message is moderate or ambiguous.

**Direction of involvement** refers to an object of the level of involvement intensity\(^{12}\). It means that the direction alludes to the incentives (for instance, product, advertisement) in relation to which the readiness is a channel\(^{13}\). This definition differs from that, which was used before, where the direction presupposed cognitive and behavioral activity connected with the

---

incentives or target objects\textsuperscript{14}. Rational cognitive and behavioral activities are the consequences of the state of involvement (as opposites to the previous).

The conditions of reasons (sources) of involvement (purchasing case, personal relevance, risk etc.) help to determine the consumer’s involvement direction or the choice of involvement focus. For example, at the experimental increase of subjectively perceived relevance of the content of advertising message, direction of this involvement will be in relation to the content of advertisement and not in relation to the background of message that is in an advertisement. It can be tested by measuring of their relative concentration in advertising content and in the message background in an advertisement (an actor, who pronounces a massage, music, colors etc.)\textsuperscript{15}.

**Stableness** of involvement refers to the duration of involvement intensity\textsuperscript{16}. For different categories of involvement there will be certainly different levels of stableness. For instance, an experienced driver, the supporter of healthy food, connoisseur of wines are expected to have a greater level of involvement stableness than those, who get in a similar situation for the first time (situational involvement)\textsuperscript{17}. Definition of involvement stableness is important, because the research essence in the context of concept of involvement can be limited by the research of category of involvement, or it is situational or transitional per se. While the involvement level from the given example continues for some time, the level of stableness of the situational involvement will fall, when an ultimate aim is attained or when a situation changes\textsuperscript{18}. But also in the situational involvement this level of stableness will also be higher for the commodities of the high involvement against the goods of low involvement. In particular, the effects of persuasion (changes of attitude, correlation of attitude and behavioral intention) will be more stable for the greater involvement. For example, in research of persuasion for brands, there was found the influence of relation of brand for the highly-attracted commodities both during the beginning of situation of involvement activity and after some time. Though at low involvement these effects do not take place \textsuperscript{19}.

\end{thebibliography}
Functional and situational determinant of involvement were also investigated by other authors\textsuperscript{20}. Thus, functional determinants are also called the stable involvement, they concern knowledge about the product category, which is got by a customer during a long time and is kept in a long-term mind\textsuperscript{21}. This knowledge base determines, to what aspects of information about the product category the customers will show attention and from what aspects of information they will refuse. In contrast to this the situational involvement is temporary and takes place for a specific purchasing situation.

The category of involvement has numerous types. Some scientists made attempts to classify them.

In literature there are suggested different modifications of the category of involvement that determine its types. American researchers of J. C. Andrews, S. Durvasula and S. H. Akhter in their work\textsuperscript{22} bring forward own classification of approaches to definition and typology of the category of involvement. According to it, there are 4 directions of involvement research, each of them has different focuses:

I. \textit{Attention as the strategy of processing}. Focuses on incentives, advertisement, messages. Measured in two dimensions: level and direction of attention;

II. \textit{Personal situational involvement}. Focuses on the problems, situation, content of advertising message. Measured by an individual level of personal urgency by the means of information about the massage or information connected with the problem;

III. \textit{Involvement of an audience into the process}. Focuses on involvement stages, certain audiences of involvement;

IV. \textit{Involvement into a product}. Focuses on the importance of product class, level or state of an individual involvement. Measured by the unidirectional or bipolar scale of intentions.

They also\textsuperscript{23} proposed a scheme for conceptualization and evaluation of involvement category, where the reasons of involvement origin are personal needs of the subject of involvement, situational factors and the factors of purchasing process. Involvement by this scheme is aimed at search activity, information processing and persuasion. According to this scheme the level of involvement is influenced both by the inner state of involvement subject and by outer factors of involvement formation. Involvement has three definite properties: intensity, direction and stableness.

\textsuperscript{20} Bloch Peter H., Richins Marsha L. \textit{A Theoretical Model …}, op. cit, pp. 69-81.
\textsuperscript{22} Celsi Richard L., Olson Jerry C. \textit{The role of involvement …}, op. cit, pp. 211-212.
\textsuperscript{23} Andrews J. Craig, Durvasula Srinivas, Akhter Syed H. \textit{A Framework for Conceptualizing …}, op. cit, pp. 31-32.
Some of the researchers\textsuperscript{24} consider that the type of involvement is determined by the factors of its formation. The dominance of one of more of them (characteristics of subject of involvement, incentives and situation) determines the level of involvement by incentives (by an environment) involvement in a product, in a purchasing situation or involvement by an advertisement. The conceptual value of the term of involvement does not change from dominance of one of these factors, involvement is always personally perceived actuality of an object.

Later on there was made an attempt to refuse from the study of involvement type subject to the source of involvement\textsuperscript{25}. However, it was suggested to consider that a consumer can be involved, if he is interested in an object, even if this object is an advertising message.

Many researchers of consumers’ behavior presented and recreated involvement through cognitive and emotional (affective) constituents. However, as the state of involvement influences actual behavior\textsuperscript{26}, values of variable levels of involvement for a behavioral constituent are the most significant for marketing specialists.

With development of branding the consumers are involved more and more in the development of brands, unite their life with a certain style, culture and standards of behavior, that are casted by certain brands. Russian scientists\textsuperscript{27} examine the consumer involvement cooperating with a brand from five points of view:

1. As a \textit{social phenomenon} that is predetermined by technological development, increase of number of Internet users, lowering of market barriers for entry and growth of global competition;

2. As the \textit{characteristics of a consumer’s behavior} that defines a customer’s motivational level by the cycle stages of involvement in the purchase. The cycle represents the consequence of stages: awareness, attention (emotional involvement), information gathering (cognitive involvement), purchase (behavioral involvement) and maintenance (loyalty);

3. As a \textit{strategical marketing target of a firm}, while the actual loyalty in conditions of market saturation is provided not much by satisfaction as by the involvement of a consumer in brand;

\textsuperscript{24} Bloch Peter H., Richins Marsha L. \textit{A Theoretical Model …}, op. cit, pp. 69-81.
\textsuperscript{27} Багиев Г. Л., Юлдашева О.У., Боброва Е. А. \textit{Как купить душу покупателя? Маркетинговая концепция вовлечения покупателей во взаимодействие с брендом}, “Креативная экономика”, №8/2008, pp. 75–76.
4. As a set of marketing tools, which include on-line and off-line marketing communications;

5. As an indicator of marketing metrics of branding effectiveness beside the indicators of awareness, satisfaction and loyalty.

Table 2 represents the author’s variant of classification of the main involvement types. The types that repeat or insignificantly modify the given types are omitted.

In the researches of two main categories of involvement (IDMP and IPC), Hunt and others\(^28\) proved that IDMP and IPC were not dimensions of the same concept. The high levels of IDMP could exist without the proportionally high levels of IPC. For example, for an entrant of institute of higher education a choice of educational establishment is an important decision (IDMP), but he can be indifferent to universities in general. Thus, for researchers of involvement it is recommended to measure both elements while each of them is not connected directly with another.

Zaichkowsky J.L.\(^29\) proposed to consider that the goods of different product classes have different involvement levels based on the perception of a certain product by a consumer.

In general the involvement level of consumer in the product class is one of the basic variables of expedient promotion strategy. Overwhelming majority of researches carry out segmentation of product categories according to the involvement level of a consumer, unit that means segmentation of consumers by the level of involvement in the decision-making process. However the groups of consumers with the different involvement levels have reactions different in efficiency on promotion means of the same product.

In the review of prospects of notion “involvement” in researches of consumers’ behavior and communications Charles T. Salmon\(^30\) notices that this definition is worth attention while it means that involvement is more cognitive process than affective state. Though he notes that a place of location of involvement in Krugman’s scheme is not fully clear; as it looks like both reaction characteristics (cognitive and affective) as well as communicational essence.

<th>Rothschild, 1984</th>
<th>An enterprise is interested in purchase of important and valuable equipment, reaction – desire and intention to make a purchase</th>
</tr>
</thead>
</table>
While investigating the role of involvement in advertising efficiency H. Krugman focuses on potential of different bearers of marketing communications for the increase of involvement level for part of middle audience. Unlike his contemporary media critic Marshall McLuhan (1964), who used terms "hot" and "cold" alluding to nature of participants of mass-media, H. Krugman used the notions of high and low levels of involvement. According to results of Krugman’s studies television is the bearer of marketing communications of low involvement, because it causes the gradual change of relation without the necessary awareness of subjects of involvement concerning changes. In such a low-involved process of study the subjects gradually become well-informed about the advertised product and its purchase that is revealed in loyal attitude toward a product. In such process the behavior is not a result, but a part of general process of choice. On the other hand, H. Krugman considers printed media to be the bearers of marketing communications of high involvement, while the reader can control the learning tempo and acquaintance with specific information necessary for choice, formation of attitude and purchasing. Thus, a level of involvement of different media is the result of different arrangement of elements of choice process.

Similarly to Krugman’s studies, the notion “involvement” as a degree to that subjects "combine" with a situation, but not focusing on interest or stimulation is determined by J.E. Grunig in the researches of communicational behavior in the situations of decision-making and not decision-making. In general, J. E. Grunig proved that regardless of that whether subjects think about a situation, or stop thinking, and in the situation of the high involvement and low limitation of recognition, they have some control over the situation and there is an increase of an active informative search as well as of passive informative processes.

P. L. Wright supported Krugman’s investigation with his own research results of cognitive reactions to communicational influence. He proved that the printed media cause

more cognitive reactions than transmitting media, and cognitive reactions were similar by essence to that, which G. Krugman used for estimation of involvement.

In contrast to Krugman’s assumptions that television is a bearer of communicational influence of low involvement level there appeared investigations of I.L. Preston. He proved that a difference in the answers of respondents to the communicational influence of television and printed media represented a difference in composition more than in a form. He considered that the printed advertisement has a tendency to be used for those product classes that have considerable differentiation among competitive brands. Because of the fact that television commercial is concentrated on goods, for which differentiation in brands is small, a consumer has the low involvement by an advertisement - but not necessarily by the means of influence itself.

T. Tyebjee also paid attention to differentiation of involvement by communication means, involvement by a program and by an advertisement. He proved that television has not to be considered the means of low involvement, but this involvement is rather specific.

Krugman’s ideas are strongly opposed by Worschel and others. They assert that television is the means of the greater involvement than printed mass media, at least through a living language. These conclusions are based on conviction that the presence of living language results in the greater involvement through hearing, and subsequently there are more changes in the relation for the benefit of purchasing result. In the process of this research authors adapted definition of the notion “involvement” that is based on interest or stimulation, but not on Krugman’s definition, where there are such concepts as "the amount of the consciously set connections" or "sending in a minute". A difference in a concept and its application causes a difference in conclusions.

The Russian scientists in their work present classification of marketing involvement instruments in co-operating with a brand, where each traditional off-line instrument has a corresponding on-line instrument of marketing involvement strategy. For example, TV commercial and other mass media advertisements are supplemented by continuous on-line

37 Багиев Г. Л., Юлдашева О. У., Боброва Е. А. Как купить душу ..., op. cit, p. 77.
dialogue on the company’s website; publication of own magazines is transformed in creation of possibilities to order personified products on a site, and also possibilities to participate in its designing; own broadcasting station or TV channel result in usage of ideas in blogs, personal sites, Internet websites.

According to the product’s price and the risk of its purchase and usage there are distinguished:

1. *The goods of high cognitive involvement.* Investment commodities foresee the highest degree of natural cognitive involvement, while being valuable and their purchase is accompanied by a risk. Such goods include the real estate, stock, educational services, insurance services, commodities of long term usage etc. High transaction costs are characteristic for such goods. Traditional promotion strategy of such commodities is in the reduction of risk of their purchase and cutback of the transaction costs. As a rule it is realized due to promotion of brand, here attention is paid to the influence on cognitive involvement of consumer, i.e. the increase of volume of his knowledge about a commodity, firm and higher trust to a brand.

2. *The goods of high emotional involvement* are first of all luxury. While these goods are rarely bought from rational considerations, so the strategy of their promotion is based on the usage of instruments that cause strong emotions and feelings.

3. *The goods of low involvement*, which include first-necessity goods and they are promoted due to the influence on emotional involvement.

The conducted researches of influence of marketing communications on the involvement level allow to assert, that the effectiveness of advertisement is 10 % more on the average for consumers with a high involvement (it is calculated by the author due to data). Thus, the involvement level is the instrument of influence on effectiveness of marketing communications, and consequently an increase of sales level.

To investigate the influence of each separate means of promotion complex we will illustrate formation of a part of involvement under influence of communication incentives (fig. 1).

---

38 Багиев Г. Л., Юлдашева О. У., Боброва Е. А. Как купить душу ..., op. cit, pp. 76-77.
Figure 1. The scheme of formation of involvement level by marketing communications

Source: own elaboration

In general, the total influence of marketing communications, except for cumulative, has also the synergetic effect, but the study of this phenomenon is not the subject of this work.

We can formally single out the components of involvement by marketing communications in the general involvement level of consumer:

\[ S = S_0 + S_{MC} = S_0 + \sum_{k=1}^{m} S_k, \]  

where \( S_0 \) is an initial involvement level that equals the involvement level formed under the influence of all factors except marketing communications,\n
\( S_{MC} \) is involvement level added by marketing communications,\n
\( S_k \) is the part of involvement formed under the influence of \( k \) element of promotion complex,\n
\( m \) is the total amount of promotion complex elements that influence the involvement level, \( k=1\ldots m \).

Let’s show the supplementary involvement levels formed under the influence of marketing communications on number axis (fig. 2)
As a result of the preliminary review of literature in the process of formation of involvement one can single out its constituents and the factors of influence that respond to one of the questions:

- **What** forms the involvement level?
- **What** can change the involvement?
- **What** constituent of involvement can be changed?
- **What** can influence the involvement level?
- **What** objects can the involvement be directed at?

After generalizing the existing researches the author developed an approach to the formation structure of involvement level that is represented in fig. 3.

The formation structure of involvement level consists of such elements:

1. The source of formation of involvement that includes all initial factors of involvement formation. The characteristics of the subject of involvement are his interests, needs, motives, values, personal importance of object of involvement or his problems and ideas. The characteristics of purchasing situation include the situation of purchase, aims, tasks, risks of purchase etc. The source of formation of involvement mostly determines the focus of involvement.

2. The incentives of involvement formation are the factors of influence on the change of involvement level directed at temporary concession of importance to the object of involvement. The incentives include the marketing complex elements: product, communicational, pricing and sales policies of an enterprise.
3. The external factors of involvement formation, environmental factors or the so-called peripheral factors are not the initial external factors of formation but indirectly influence the involvement level.

4. The focus of involvement formation is the target object of involvement that is determined by the direction of involvement on the basis of involvement sources. The focus of involvement can be the product class, decision-making process concerning the purchase, advertisement or communication in general, brand, a certain problem or idea etc.

5. The properties of involvement: intensity, direction and stableness.

6. The formation process of involvement goes through the stages of decision-making process concerning the purchase and presents the set of involvement constituents (cognitive, affective and conative involvement) that correspond to the stages of hierarchy of communicational effects. The correspondence of the stages of decision-making process
concerning the purchase to the steps of hierarchy of communicational effects and constituents of involvement formation is given in fig. 4.

Figure 4. The place of constituents of the process of involvement formation in decision-making process concerning the purchase

1. Understanding of a need
2. Search of information about the product
3. Evaluation of alternatives
4. Decision about the purchase
5. Reaction to the purchase

Hierarchy of communicational effects
- Awareness
- Knowledge
- Liking
- Preference
- Conviction
- Purchase

Cognitive involvement
Affective involvement
Conative involvement

Source: own elaboration

Summary. To make a conclusion, there were considered approaches to the definition of the notion “involvement” and to the classification of the main types of involvement. The classification of involvement was supplemented according to involvement by marketing incentives (involvement by communicational, product, pricing and sales policies) and according to the combination of types (involvement as a reaction). The classification was supplemented by the peculiarities of display of different involvement types of enterprises-consumers at machine building market. There was expanded the classification of involvement types by a base of information process via the notion of conative involvement. There were defined and scientifically grounded the notions of conative involvement and the focus of involvement. The existing researches of the factors of involvement formation allowed to develop the author’s systematization of formation of involvement level. The further task is to elaborate the methodical instruments for definition of involvement level and its management.

Abstract.

Study and systematization of approaches to the definition of the notion of “involvement” and its types, development of involvement level formation structure, definition of the place of the involvement components during the process of a decision making by the organization-consumer is the aim of this work.

According to the aim, the available basic approaches to the definition of the involvement category within the system of promotion of industrial innovative products are arranged in the paper as follows: the motivational approach, where the aspect, to which the main attention is paid, is personal motivation of a customer (including internal, external and general motivational approaches, which show the dependence on internal, external factors or on combination of factors); the expensive approach, where the attention is paid to the total expenses of the customer for purchasing and the approach, according to which an involvement is considered as a direction on communication.

The main properties of involvement are determined: intensity, direction and stability. Existing approaches to the classification of involvement types are synthesized in a general classification of types according to the features: a source of involvement, an object of involvement, intensity, stability and base of information processes. Classification of involvement is supplemented with involvement by marketing incentives (involvement with communication, product, price, and sale policy) and a combination of types (involvement as reaction).

Classification of types of involvement is extended according to the base of information processes by the notion of “conative involvement”, by the science-based definition of conative involvement as a degree of personal relevance of a message that determine the behavior of a customer. Classification is also supplemented by the peculiarities of display of different types of involvement of the enterprises-customers on a machine building market. On the basis of justification of the involvement focus formation conditions we determined it as the involvement target object depending on the sources. Systematization of factors of formation of companies-customers involvement level is developed. The place of involvement components in decision-making process by enterprises-customers is defined.

The theoretical and methodological basis of the research is a modern concept of marketing innovation, experts research papers.
